

Estimating the Factors That Explain Economists' Time Preferences

Bailey Smith

Linfield Department of Economics • Spring 2016

I. Abstract

Theory suggests that individuals' characteristics, such as age and gender, may affect their rates of time preference. This paper empirically explores this "characteristic-time preference relationship." Our sample is drawn from survey responses of economists belonging to the Association of Environmental and Resource Economics. We find that ideology, age, field of study, and the size of the institution where economists are employed are significant factors explaining economists' time preferences.

II. Model

- Statement: "I just don't have the time to worry about how all of my actions affect the environment"
- Level of Agreement with Statement = $f(\text{Ideology}_i, \text{Age}_i, Z_i)$
 - Ideology: The individual's political views ordered from very conservative to very liberal.
 - Age: The age of the individual ordered from younger to older.
 - Z_i : Additional control variables such as the Size of the institution where the person is employed.

* i indexes individuals

III. Hypotheses

- Ideology: We expect that the more liberal is a person, the less likely he or she is to agree with the Statement.
 - This implies that the more liberal is a person, the more future oriented he or she is.
- Age: We hypothesize that the older is an individual, the more likely he or she is to agree with the Statement.
 - This implies that the older is the individual, the more present oriented he or she is.

IV. Data

- Cross sectional data from the Survey of AERE Economists.
- Data Sample includes 269 economists.

VI. Conclusion

- The coefficients of ideology, age, and size of the academic institution by enrollment are significant at a 5% level of confidence.
- The regression predicts 62.35% of responses correctly.
 - For responses of disagreement to the Statement, 82.69% were correctly predicted.
 - For responses of agreement to the Statement, 27.47% were correctly predicted.
- The coefficient of Ideology = -0.100
 - Implies that the more liberal is a person, the less likely he or she is to agree with the Statement. This indicates that, consistent with our hypothesis, more liberal people are more future oriented.
- The coefficient of Age = -0.162
 - Implies that the older is a person, the less likely he or she is to agree with the statement. Counter to our hypothesis, this indicates that as people age they become more future oriented.
