Oregon 1986 Vineyard Acreage
S. D. Miles

Introduction
Oregon State University's Department of Agricultural and Resource Economics conducted a wine grape acreage survey in Oregon for the 1986 production year. Wine grape acreage has been increasing dramatically, and the Wine Advisory Board (WAB) is interested in keeping track of those changes. In 1981, 1982, and 1984 the department made surveys of acreage by county for both bearing and nonbearing vineyards. This 1986 survey also asked for information about the acreage established in 1986, those planned for 1987, and the quantity of grapes sold out of state.

This report contains some comparisons made with the data from the other surveys. The data are not directly comparable because some of the vineyards reporting in 1986 are new or different from those reporting in the past. The 2-year comparisons are given to provide an indication of the changes taking place in the industry.

Although various methods were used to get names and addresses of vineyard operators to include in the survey, we could not contact them all, and some did not respond. However, it is our estimate that the numbers included here are estimated to represent 80% or more of the established vineyard acreage.

Acres reported by variety
The 1986 survey shows an increase in bearing acreage from 1,040 in 1984 to 2,186 in 1986. This 1,146 acre increase more than doubled the bearing acreage of vineyards in Oregon. At the same time, nonbearing acres were down 29%, with total acreage up 14% to 3,845 acres. The decrease in nonbearing acreage reflects the fact that acreage is now shifting into the bearing category.

Pinot Noir, White Riesling, and Chardonnay continue to be the primary varieties in Oregon. These three varieties represented 76% of the bearing acres in

* Chenin Blanc was not reported separately in previous reports.

Stanley D. Miles, Extension economist, Economic Information Office, Oregon State University.
1986 and 70% of the total vineyard acres reported in this survey.

While nonbearing acreage is dropping off, there is continued interest in Muller Thurgau (table 1). This report shows a total of 164 acres planted, with a 74% increase in nonbearing acres between 1984 and 1986.

The increase in total vineyard acreage reported between 1982 and 1984 was 1,549 acres. This current survey has a reported increase of 483 acres between 1984 ad 1986. While the wine industry is far from mature, these figures reflect a slowing down in new vineyard establishment.

If the 3,845 acres reported for 1986 represent 80% of vineyard acres in Oregon, then total acreage planted in the state is about 4,800 acres. If the surveyed vineyard represent more than 80% then there are less than 4,800 acres.

**Acres reported by county**

The primary areas of wine grape production in Oregon are the Willamette Valley and the Douglas-Jackson-Josephine county area (table 2). The three counties with the largest bearing acreage are Polk, Washington, and Yamhill in the Willamette Valley. Morrow county is also showing significant potential with over 700 acres about to come into production.

In 1986, there were 187 vineyards reporting bearing and/or nonbearing acreage. (In 1984, reports were received from 179 wine grape growers.) Of the 187 vineyards, 126 (two-thirds) were from Willamette Valley counties.

The size of Oregon vineyards

Vineyards in Oregon are relatively small (table 3). Of the 187 vineyards reporting, only 27 had 30 acres or more planted to wine grapes. One hundred forty-one of the 187 had 20 or fewer acres. However, in comparing similar tables from the 1982 and 1984 survey, it is apparent that the vineyards' average size is gradually increasing.

Yields and prices

While acres by variety were quite consistently reported on the survey forms, the yield and price data were not very complete. We calculated "weighted averages" using the acreage and yield reported for each vineyard. We didn't use acreage on forms not reporting yield (table 4).

It is interesting to note that average yields reported in 1986 were lower than those reported in 1984. There were many comments concerning frost and bird damage on the 1986 survey forms.

In previous reports, concern was indicated because of the low yields. Given the higher yields received from some mature vineyards, it appears that Oregon vineyards have the potential of attaining profitable production levels. (The low yields in the table represent acreage that is just coming into production.)

The prices reported for 1986 were either higher than, or about the same as, those in the 1984 report. For example, the average price for Pinot Noir in 1984 was $506 per ton and in 1986 was $647.

Please note the great variation in prices. There is a wide spread between the high and the low for most varieties. Much of this variation is probably caused by differences in quality (no quality standard was used in the survey). Sugar content, bunch rot, material other than grapes, etc., all affect price and/or yield.
Total production and grapes sold out of state

Table 4.5 is a rough estimate of the 1986 production of the six leading varieties. Multiplying the weighted average yields times bearing acres gives the total tons produced. Using 150 gallons per ton provides an estimate of total gallons produced. This calculation is about 730,000 gallons for these six varieties, and there would be some additional production from other varieties. According to one report, the Oregon Liquor Control Commission listed over 4,300 tons for 1986. Using 150 gallons per ton, we calculated about 650,000 gallons.

The survey requested data on grapes sold out of state. A total of 172 tons were reported: 76.6 tons of Pinot Noir, 1.5 tons of White Reisling, and 93.7 tons of Chardonnay. All but 7 ton of these grapes come from the Willamette Valley.

Subtracting the out-of-state tonnage from our estimated production leaves 4,691 tons. Assuming some home use and losses, these estimates are quite close to the Oregon Liquor Control figure, indicating that we are probably getting almost all of the grapes reported in the survey.

* Assuming 150 gallons per ton.
New plantings of wine grapes

We asked for information on acreage planted in 1986 and planned for 1987 (see table 5). Respondents indicated that they planted 205 acres in 1986 and planned to establish another 215 acres in 1987. (A note of caution: The 205 acres planted in 1986 are included in the nonbearing figures in other tables.)

These numbers are down dramatically from 1984 (1,011 acres) and 1985 (650 acres) as shown in table 5. Please note: The 1985 and 1987 figures are "planned" acreage.

Even in the new plantings, the top three varieties (Pinot Noir, White Riesling, and Chardonnay) are predominant. These figures reflect the continued interest in Muller Thurgau and Pinot Gris.

Looking ahead

The Oregon wine industry has a low-volume, high-quality and relatively high-priced product. Many people have worked very hard to develop the reputation and quality of Oregon wines. Careful planning is needed because this industry is expanding rapidly.

American agriculture has been blessed with research, Extension, new varieties, new technology, etc. With all of this, total production of all crops has increased dramatically over the years. Production is so great in some commodities that there are government programs to reduce acreage, find new markets, and control storage and carryover supplies.

This is a critical time in the development of the Oregon wine industry. As a group, the wine grape growers and the wineries need to make sure the market for the product is expanded as fast as production. Thoughtful planning may avoid the problems experienced in some other phases of agriculture.

Given a year with favorable weather, lower bird damage, and three large vineyards coming into production, it is conceivable that we could have up to twice the grape production reported in 1986. If this were to happen, does the industry have the capacity to handle all the grapes, and are there established markets to handle this magnitude of Oregon Wine?

* Vineyards whose 1986 acreage was estimated from information they provided in the 1984 survey.
Extension Service, Oregon State University, Corvallis, O.E. Smith, director. This publication was produced and distributed in furtherance of the Acts of Congress of May 8 and June 30, 1914. Extension work is a cooperative program of Oregon State University, the U.S. Department of Agriculture, and Oregon counties.

Oregon State University Extension Service offers educational programs, activities, and materials—without regard to race, color, national origin, sex, or disability—as required by Title VI of the Civil Rights Act of 1964, Title IX of the Education Amendments of 1972, and Section 504 of the Rehabilitation Act of 1973. Oregon State University Extension Service is an Equal Opportunity Employer.
